## OPTRONIC LABORATORIES

## STELLAR MAGNITUDES

The brightness of celestial bodies is usually measured in magnitudes. The scale of magnitudes is adjusted so that a star of magnitude +1.00 (first Magnitude) gives a luminous flux of $0.832 \times 10^{-10}$ lumen $\mathrm{cm}^{-2}$ at a point outside the atmosphere of the earth.

The relation between the visible light received from two stars and their magnitudes is expressed by the formula:

$$
\begin{aligned}
& \quad \log _{10} \frac{l_{1}}{/ 2}=0.4\left(m_{2}-m_{1}\right) \\
& \text { or } \quad m_{2}=m_{1}+2.5 \log _{10}\left(\frac{.832 \times 10^{-10}}{/_{2}}\right) \\
& \text { or } \quad I_{2}=\frac{0.832 \times 10^{-10}}{10^{0.4\left(m_{2}-1\right)}}
\end{aligned}
$$

$$
\text { where } \begin{aligned}
I_{1} & =\text { illuminance }\left(.832 \times 10^{-10}\right) \\
& m_{1}=\text { magnitude }(1.0)
\end{aligned}
$$

| M ${ }_{2}$ (MAGNITUDE) | /2 (lumens / cm²) | M ${ }_{2}$ (MAGNITUDE) | $I_{2}$ (lumens / cm²) |
| :---: | :---: | :---: | :---: |
| -11 | $0.525 \times 10^{-05}$ | 1 | $0.832 \times 10^{-10}$ |
| -10 | $0.209 \times 10^{-05}$ | 2 | $0.331 \times 10^{-10}$ |
| -9 | $0.832 \times 10^{-06}$ | 3 | $0.132 \times 10^{-10}$ |
| -8 | $0.331 \times 10^{-06}$ | 4 | $0.525 \times 10^{-11}$ |
| -7 | $0.132 \times 10^{-06}$ | 5 | $0.209 \times 10^{-11}$ |
| -6 | $0.525 \times 10^{-07}$ | 6 | $0.832 \times 10^{-12}$ |
| -5 | $0.209 \times 10^{-07}$ | 7 | $0.331 \times 10^{-12}$ |
| -4 | $0.832 \times 10^{-08}$ | 8 | $0.132 \times 10^{-12}$ |
| -3 | $0.331 \times 10^{-08}$ | 9 | $0.525 \times 10^{-13}$ |
| -2 | $0.132 \times 10^{-08}$ | 10 | $0.209 \times 10^{-13}$ |
| -1 | $0.525 \times 10^{-09}$ | 11 | $0.832 \times 10^{-14}$ |
| 0 | $0.209 \times 10^{-09}$ | 12 | $0.331 \times 10^{-14}$ |
